Local Methods

- Turquoise slides: Alpaydin
- Blue slides: Haykin, clarifications/notations

- ullet $\mathcal{X} = \{\mathbf{x}^t\}_t$: set of samples (green).
- $\mathbf{m}_i, i = 1, 2, ..., k$: cluster centers (red).
- b_i^t : if \mathbf{m}_i is closest to \mathbf{x}^t , 1.
- Note: t = index for input, i = index for cluster center.

Introduction

 Divide the input space into local regions and learn simple (constant/linear) models in each patch

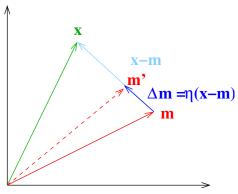

- Unsupervised: Competitive, online clustering
- Supervised: Radial-basis functions, mixture of experts

Lecture Notes for E Alpaydın 2010 Introduction to Machine Learning 2e © The MIT Press (V1.0)

Competetive Learning: k-Means

- Batch: update cluster centers according to simple "mean" at each moment.
- Online: Use stochastic gradient descent.
 - Note: \mathbf{m}_i is a vector, having scalar components m_{ij} (see next page).
 - Typo in the next page: E term should contain $||...||^2$
- Both are iteratively done until convergence is achieved.

Competetive Learning

- Updating the center.
- $\Delta \mathbf{m} = \eta(\mathbf{x} \mathbf{w})$
- $\mathbf{m} = \mathbf{m} + \eta(\mathbf{x} \mathbf{w})$
- "Move center closer to the current input"

Replacing b_i^t , etc.

- ullet We can use *lateral inhibition* to implement b_i^t in a more biologically plausible manner (see figure in next slide). Needs iteration until vlaues settle.
- We can also use dot product instead of Euclidean distance as a distance measure.
- Hebbian learning is usually used for biologically plausible models.

Competitive Learning

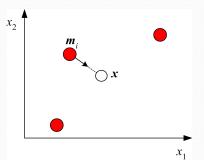

$$E(\{\mathbf{m}_{i}\}_{i=1}^{k}|\mathcal{X}) = \sum_{t} \sum_{i} b_{i}^{t} \|\mathbf{x}^{t} - \mathbf{m}_{i}\|$$

$$b_{i}^{t} = \begin{cases} 1 & \text{if } \|\mathbf{x}^{t} - \mathbf{m}_{i}\| = \min_{i} \|\mathbf{x}^{t} - \mathbf{m}_{i}\| \\ 0 & \text{otherwise} \end{cases}$$

Batch k-means: $\mathbf{m}_i = \frac{\sum_t b_i^t \mathbf{x}^t}{\sum_t b_i^t}$

Online *k*-means:

$$\Delta m_{ij} = -\eta \frac{\partial E^t}{\partial m_{ij}} = \eta b_i^t \left(x_j^t - m_{ij} \right)$$

Lecture Notes for E Alpaydin 2010 Introduction to Machine Learning 2e © The MIT Press (V1.0)

Initialize $oldsymbol{m}_i, i=1,\ldots,k$, for example, to k random $oldsymbol{x}^t$ Repeat

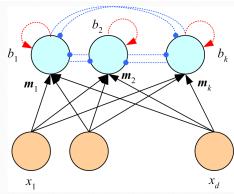

For all ${m x}^t \in \mathcal{X}$ in random order

$$i \leftarrow \arg\min_{j} \|\boldsymbol{x}^t - \boldsymbol{m}_j\|$$

$$m{m}_i \leftarrow m{m}_i + \eta (m{x}^t - m{m}_j)$$

Until $oldsymbol{m}_i$ converge

Winner-take-all network

Adaptive Resonance Theory

 Incremental; add a new cluster if not covered; defined by vigilance, ρ

$$\begin{aligned} \boldsymbol{b}_{i}^{t} &= \left\| \mathbf{x}^{t} - \mathbf{m}_{i} \right\| = -\min_{l=1}^{k} \mathbf{n} \left\| \mathbf{x}^{t} - \mathbf{m}_{l} \right\| \\ \int \mathbf{m}_{k+1} \leftarrow \mathbf{x}^{t} & \text{if } b_{i} > \rho \\ \Delta \mathbf{m}_{i} &= \eta \left(\mathbf{x}^{t} - \mathbf{m}_{i} \right) & \text{otherwise} \end{aligned}$$

(Carpenter and Grossberg, 1988)

Redundancy, etc.

- Unsupervised learning such as SOM require redundancy in the data.
- The following are intimately related:
 - Redundancy
 - Structure (or organization)
 - Information content relative to channel capacity

SOM Overview

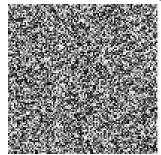

SOM is based on three principles:

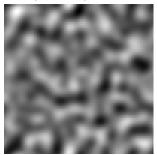

- **Competition**: each neuron calculates a discriminant function. The neuron with the highest value is declared the winner.
- Cooperation: Neurons near-by the winner on the lattice get a chance to adapt.
- Adaptation: The winner and its neighbors increase their discriminant function value relative to the current input.
 Subsequent presentation of the current input should result in enhanced function value.

Redundancy in the input is needed!

5

Redundancy, etc. (cont'd)

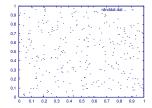

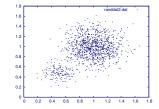

| | Left | Right |
|---|------|-------|
| Structure | No | Yes |
| Redundancy | No | Yes |
| Info <capacity< td=""><td>No</td><td>Yes</td></capacity<> | No | Yes |

Consider each pixel as one random variable.

Redundancy, etc. (cont'd)

| | Left | Right |
|---|------|-------|
| Structure | No | Yes |
| Redundancy | No | Yes |
| Info <capacity< td=""><td>No</td><td>Yes</td></capacity<> | No | Yes |

Consider each axis as one random variable.

8

SOM Algorithm

- 1. Randomly initialize weight vectors \mathbf{w}_i
- 2. Randomly sample input vector \mathbf{x}
- 3. Find Best Matching Unit (BMU):

$$\mathbf{i}(\mathbf{x}) = \operatorname{argmin}_{j} \|\mathbf{x} - \mathbf{w}_{j}\|$$

4. Update weight vectors:

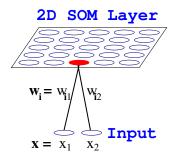

$$\mathbf{w_j} \leftarrow \mathbf{w}_j + \eta h(j, i(x))(\mathbf{x} - \mathbf{w}_j)$$

 η : learning rate

h(j,i(x)) : neighborhood function of BMU.

5. Repeat steps 2 – 4.

Self-Organizing Map (SOM)

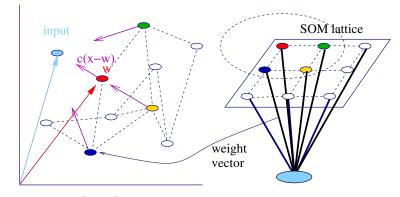

Kohonen (1982)

- 1-D, 2-D, or 3-D layout of units.
- One weight vector for each unit.
- Unsupervised learning (no target output).

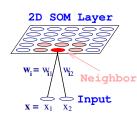

9

SOM Learning

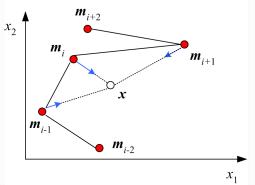

Input Space

- Weight vectors can be plotted in the input space.
- Weight vectors move, not according to their proximity to the input in the input space, but according to their proximity in the lattice.

Self-Organizing Maps

- Units have a neighborhood defined; m_i is "between" m_{i-1} and m_{i+1} , and are all updated together
- One-dim map:

(Kohonen, 1990)

$$\Delta \mathbf{m}_{I} = \eta e(I, i) (\mathbf{x}^{t} - \mathbf{m}_{I})$$

$$e(l,i) = \frac{1}{\sqrt{2\pi\sigma}} \exp \left[-\frac{(l-i)^2}{2\sigma^2} \right]$$

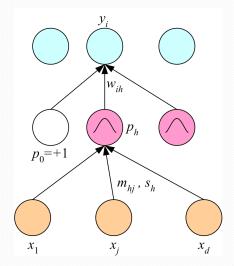

Lecture Notes for E Alpaydın 2010 Introduction to Machine Learning 2e © The MIT Press (V1.0)

Radial-Basis Functions

Locally-tuned units:

$$p_h^t = \exp\left[-\frac{\left\|\mathbf{x}^t - \mathbf{m}_h\right\|^2}{2s_h^2}\right]$$

$$y^t = \sum_{h=1}^H w_h p_h^t + w_0$$

Typical Neighborhood Functions

exp(-(x*x+y*y)/2)

- Gaussian: $h(j, i(x)) = \exp(-\|\mathbf{r}_j \mathbf{r}_{i(x)}\|^2/2\sigma^2)$
- Flat: h(j, i(x)) = 1 if $\|\mathbf{r}_j \mathbf{r}_{i(x)}\| \le \sigma$, and 0 otherwise.
- \bullet σ is called the **neighborhood radius**.
- \mathbf{r}_j is the location of unit j on the lattice.

13

RBF

- Input x to p: cluster centers \mathbf{m} and radius (variance) s are estimated.
- p to output weights \mathbf{w} can be calculated in one shot using pseudo inverse (output units are usually linear units). n RBF activation values (each row in \mathbf{P} is the RBF activation values generated from each input vector), H RBF units, m output units.

$$\begin{bmatrix} p_{11} & p_{12} & \cdots & p_{1}H \\ p_{21} & p_{22} & \cdots & p_{2}H \\ \vdots & \vdots & \vdots & \vdots \\ p_{n1} & p_{n2} & \cdots & p_{n}H \end{bmatrix} \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_H \end{bmatrix} = \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_m \end{bmatrix}$$

$$P\mathbf{w} = \mathbf{y}$$

$$\mathbf{w} = \mathbf{P}^{-1}\mathbf{y}, \text{ if } n = H$$

$$\mathbf{w} = (\mathbf{P}^T \mathbf{P})^{-1} \mathbf{P}^T \mathbf{y}, \text{ if } n > H$$

• Other iterative methods also exist (see next few slides).

Training RBF

- Hybrid learning:
 - First layer centers and spreads: Unsupervised *k*-means
 - Second layer weights:
 Supervised gradient-descent
- Fully supervised
- (Broomhead and Lowe, 1988; Moody and Darken, 1989)

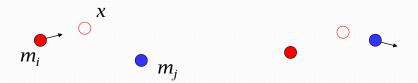

Lecture Notes for E Alpaydın 2010 Introduction to Machine Learning 2e © The MIT Press (V1.0)

10

Learning Vector Quantization

- H units per class prelabeled (Kohonen, 1990)
- Given **x**, **m**, is the closest:

$$\begin{cases}
\Delta \mathbf{m}_{i} = \eta (\mathbf{x}^{t} - \mathbf{m}_{i}) & \text{if label}(\mathbf{x}^{t}) = \text{label}(\mathbf{m}_{i}) \\
\Delta \mathbf{m}_{i} = -\eta (\mathbf{x}^{t} - \mathbf{m}_{i}) & \text{otherwise}
\end{cases}$$

Regression

$$E(\{\mathbf{m}_{h}, s_{h}, \mathbf{w}_{ih}\}_{i,h} \mid \mathcal{X}) = \frac{1}{2} \sum_{t} \sum_{i} (\mathbf{r}_{i}^{t} - \mathbf{y}_{i}^{t})^{2}$$

$$\mathbf{y}_{i}^{t} = \sum_{h=1}^{H} \mathbf{w}_{ih} \mathbf{p}_{h}^{t} + \mathbf{w}_{i0}$$

$$\Delta \mathbf{w}_{ih} = \eta \sum_{t} (\mathbf{r}_{i}^{t} - \mathbf{y}_{i}^{t}) \mathbf{p}_{h}^{t}$$

$$\Delta \mathbf{m}_{hj} = \eta \sum_{t} \left[\sum_{i} (\mathbf{r}_{i}^{t} - \mathbf{y}_{i}^{t}) \mathbf{w}_{ih} \right] \mathbf{p}_{h}^{t} \frac{(\mathbf{x}_{j}^{t} - \mathbf{m}_{hj})}{s_{h}^{2}}$$

$$\Delta s_{h} = \eta \sum_{t} \left[\sum_{i} (\mathbf{r}_{i}^{t} - \mathbf{y}_{i}^{t}) \mathbf{w}_{ih} \right] \mathbf{p}_{h}^{t} \frac{\|\mathbf{x}^{t} - \mathbf{m}_{h}\|^{2}}{s_{h}^{3}}$$
