# What is relation extraction?

Many slides adapted from Dan Jurafsky

### **Extracting relations from text**

- Company report: "International Business Machines Corporation (IBM or the company) was incorporated in the State of New York on June 16, 1911, as the Computing-Tabulating-Recording Co. (C-T-R)..."
- Extracted Complex Relation:

**Company-Founding** 

Company IBM

Location New York

Date June 16, 1911

Original-Name Computing-Tabulating-Recording Co.

But we will focus on the simpler task of extracting relation triples

Founding-year(IBM,1911)

Founding-location(IBM, New York)

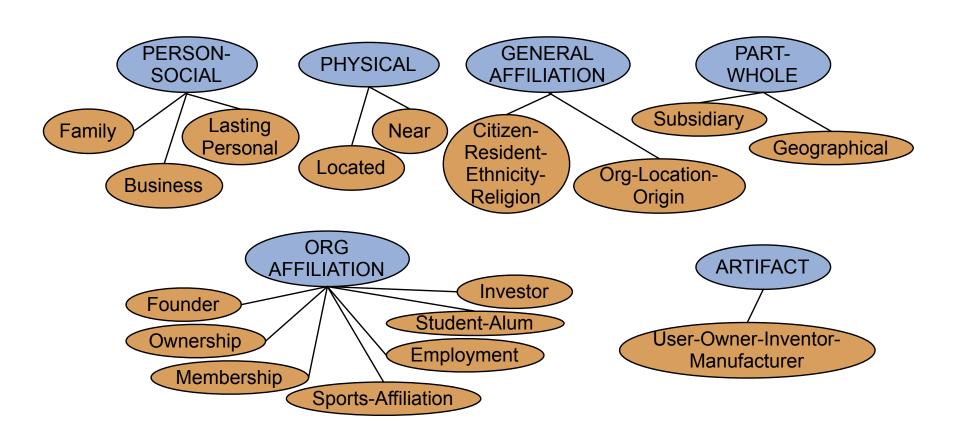

### Why Relation Extraction?

- Create new structured knowledge bases, useful for any app
- Augment current knowledge bases
  - Adding words to WordNet thesaurus, facts to FreeBase or DBPedia
- Support question answering
  - The granddaughter of which actor starred in the movie "E.T."?

    (acted-in ?x "E.T.")(is-a ?y actor)(granddaughter-of ?x ?y)
- But which relations should we extract?

## **Automatic Content Extraction (ACE)**

17 relations from 2008 "Relation Extraction Task"

### **Automatic Content Extraction (ACE)**

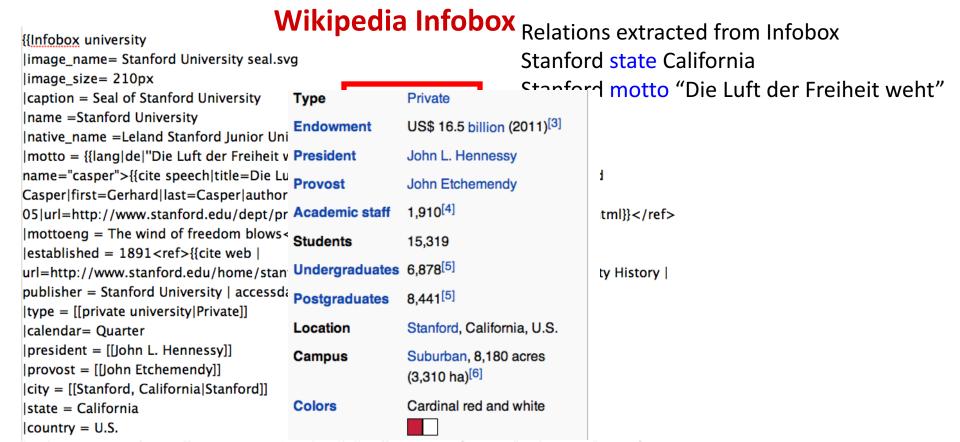

- Physical-Located PER-GPE
   He was in Tennessee
- Part-Whole-Subsidiary ORG-ORG
   XYZ, the parent company of ABC
- Person-Social-Family PER-PER
   John's wife Yoko
- Org-AFF-Founder PER-ORG
   Steve Jobs, co-founder of Apple...

## **UMLS: Unified Medical Language System**

134 entity types, 54 relations

Injury	disrupts	Physiological Function
<b>Bodily Location</b>	location-of	Biologic Function
Anatomical Structure	part-of	Organism
Pharmacologic Substance	causes	Pathological Function
Pharmacologic Substance	treats	Pathologic Function

## **Databases of Wikipedia Relations**

## How to build relation extractors

- 1. Hand-written patterns
- 2. Supervised machine learning
- 3. Semi-supervised and unsupervised
  - Bootstrapping (using seeds)
  - Distant supervision
  - Unsupervised learning from the web

What is relation extraction?

Using patterns to extract relations

## **Extracting Richer Relations Using Rules**

- Intuition: relations often hold between specific entities
  - located-in (ORGANIZATION, LOCATION)
  - founded (PERSON, ORGANIZATION)
  - cures (DRUG, DISEASE)
- Start with Named Entity tags to help extract relation!

## Named Entities aren't quite enough. Which relations hold between 2 entities?

Cure?

Prevent?

Cause?

Disease

#### What relations hold between 2 entities?

Founder?

Investor?

Member?

Employee?

**President?** 

**ORGANIZATION** 

## **Extracting Richer Relations Using Rules and Named Entities**

Who holds what office in what organization?

PERSON, POSITION of ORG

George Marshall, Secretary of State of the United States

PERSON(named appointed chose etc.) PERSON Prep? POSITION

• Truman appointed Marshall Secretary of State

PERSON [be]? (named | appointed | etc.) Prep? ORG POSITION

George Marshall was named US Secretary of State

## Hand-built patterns for relations

- Plus:
  - Human patterns tend to be high-precision
  - Can be tailored to specific domains
- Minus
  - Human patterns are often low-recall
  - A lot of work to think of all possible patterns!
  - Don't want to have to do this for every relation!
  - We'd like better accuracy

Using patterns to extract relations

Supervised relation extraction

## Supervised machine learning for relations

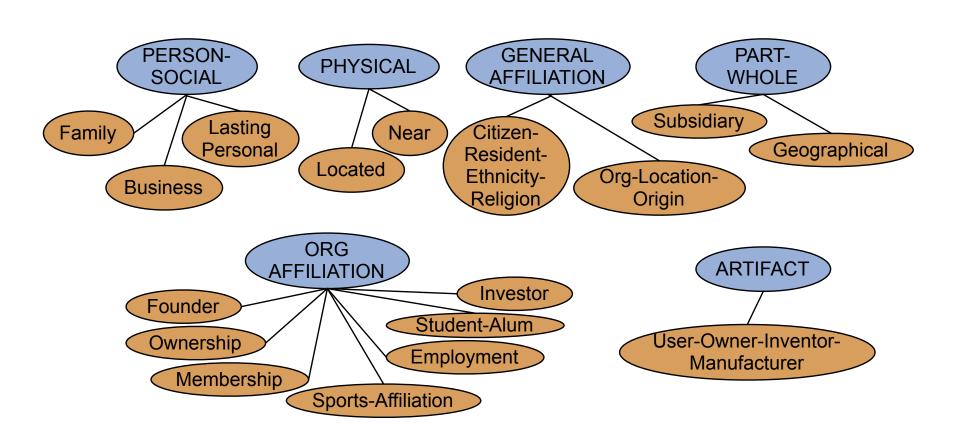

- Choose a set of relations we'd like to extract
- Choose a set of relevant named entities
- Find and label data
  - Choose a representative corpus
  - Label the named entities in the corpus
  - Hand-label the relations between these entities
  - Break into training, development, and test
- Train a classifier on the training set

# How to do classification in supervised relation extraction

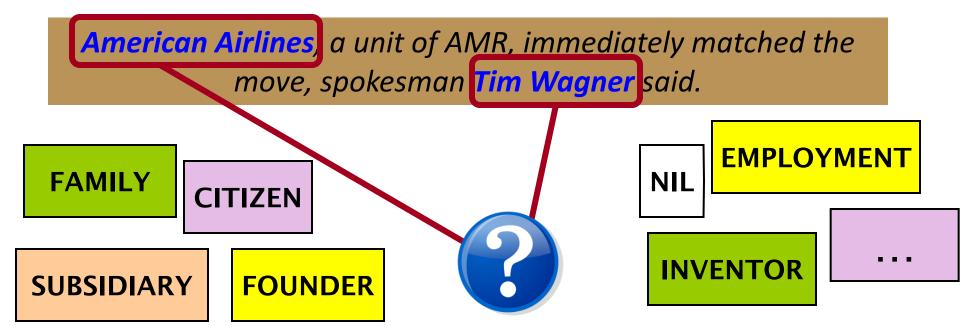

- 1. Find all pairs of named entities (usually in same sentence)
- 2. Decide if 2 entities are related
- 3. If yes, classify the relation
- Why the extra step?
  - Faster classification training by eliminating most pairs
  - Can use distinct feature-sets appropriate for each task.

## **Automated Content Extraction (ACE)**

17 sub-relations of 6 relations from 2008 "Relation Extraction Task"

Classify the relation between two entities in a sentence

#### **Word Features for Relation Extraction**

American Airlines, a unit of AMR, immediately matched the move, spokesman Tim Wagner said

Mention 1

Mention 2

- Headwords of M1 and M2, and combination
   Airlines Wagner Airlines-Wagner
- Bag of words and bigrams in M1 and M2
   {American, Airlines, Tim, Wagner, American Airlines, Tim Wagner}
- Words or bigrams in particular positions left and right of M1/M2
   M2: -1 spokesman
   M2: +1 said
- Bag of words or bigrams between the two entities
  - {a, AMR, of, immediately, matched, move, spokesman, the, unit}

## Named Entity Type and Mention Level Features for Relation Extraction

American Airlines, a unit of AMR, immediately matched the move, spokesman Tim Wagner said
Mention 1
Mention 2

- Named-entity types
  - M1: ORG
  - M2: PERSON
- Concatenation of the two named-entity types
  - ORG-PERSON
- Entity Level of M1 and M2 (NAME, NOMINAL, PRONOUN)
  - M1: NAME [it or he would be PRONOUN]
  - M2: NAME [the company would be NOMINAL]

#### Parse Features for Relation Extraction

American Airlines, a unit of AMR, immediately matched the move, spokesman Tim Wagner said

Mention 1

Mention 2

- Base syntactic chunk sequence from one to the other
   NP NP PP VP NP NP
- Constituent path through the tree from one to the other  $NP \uparrow NP \uparrow S \uparrow S \lor NP$
- Dependency path
   Airlines matched Wagner said

## Gazeteer and trigger word features for relation extraction

- Trigger list for family: kinship terms
  - parent, wife, husband, grandparent, etc. [from WordNet]
- Gazeteer:
  - Lists of useful geo or geopolitical words
    - Country name list
    - Other sub-entities

## **American Airlines**, a unit of AMR, immediately matched the move, spokesman Tim Wagner said.

Entity-based features	
Entity <sub>1</sub> type	

ORG

Entity<sub>1</sub> head airlines

Entity<sub>2</sub> type PERS Entity<sub>2</sub> head Wagner

Concatenated types ORGPERS

#### Word-based features

Between-entity bag of words { a, unit, of, AMR, Inc., immediately, matched, the, move, spokesman }

Word(s) before Entity<sub>1</sub> NONE Word(s) after Entity<sub>2</sub> said

#### Syntactic features

Constituent path  $NP \uparrow NP \uparrow S \uparrow S \downarrow NP$ 

 $NP \rightarrow NP \rightarrow PP \rightarrow NP \rightarrow VP \rightarrow NP \rightarrow NP$ Base syntactic chunk path

Typed-dependency path  $Airlines \leftarrow_{subj} matched \leftarrow_{comp} said \rightarrow_{subj} Wagner$ 

## Classifiers for supervised methods

- Now you can use any classifier you like
  - MaxEnt
  - Naïve Bayes
  - SVM
  - ...
- Train it on the training set, tune on the dev set, test on the test set

## **Evaluation of Supervised Relation Extraction**

Compute P/R/F<sub>1</sub> for each relation

$$P = \frac{\text{# of correctly extracted relations}}{\text{Total # of extracted relations}}$$

$$R = \frac{\text{\# of correctly extracted relations}}{\text{Total \# of gold relations}}$$

$$F_1 = \frac{2PR}{P+R}$$

## **Summary: Supervised Relation Extraction**

- + Can get high accuracies with enough hand-labeled training data, if test similar enough to training
- Labeling a large training set is expensive
- Supervised models are brittle, don't generalize well to different genres

Supervised relation extraction

Semi-supervised and unsupervised relation extraction

## Seed-based or bootstrapping approaches to relation extraction

- No training set? Maybe you have:
  - A few seed tuples or
  - A few high-precision patterns
- Can you use those seeds to do something useful?
  - Bootstrapping: use the seeds to directly learn to populate a relation

## **Relation Bootstrapping (Hearst 1992)**

- Gather a set of seed pairs that have relation R
- Iterate:
  - 1. Find sentences with these pairs
  - 2. Look at the context between or around the pair and generalize the context to create patterns
  - 3. Use the patterns for grep for more pairs

## **Bootstrapping**

- <Mark Twain, Elmira> Seed tuple
  - Grep (google) for the environments of the seed tuple

"Mark Twain is buried in Elmira, NY."

X is buried in Y

"The grave of Mark Twain is in Elmira"

The grave of X is in Y

"Elmira is Mark Twain's final resting place"

Y is X's final resting place.

- Use those patterns to grep for new tuples
- Iterate

## **Dipre**: Extract <author,book> pairs

Brin, Sergei. 1998. Extracting Patterns and Relations from the World Wide Web.

Start with 5 seeds:

Author	Book
Isaac Asimov	The Robots of Dawn
David Brin	Startide Rising
James Gleick	Chaos: Making a New Science
Charles Dickens	Great Expectations
William Shakespeare	The Comedy of Errors

Find Instances:

The Comedy of Errors, by William Shakespeare, was

The Comedy of Errors, by William Shakespeare, is

The Comedy of Errors, one of William Shakespeare's earliest attempts

The Comedy of Errors, one of William Shakespeare's most

Extract patterns (group by middle, take longest common prefix/suffix)

Now iterate, finding new seeds that match the pattern

### **Distant Supervision**

Snow, Jurafsky, Ng. 2005. Learning syntactic patterns for automatic hypernym discovery. NIPS 17 Fei Wu and Daniel S. Weld. 2007. Autonomously Semantifying Wikipeida. CIKM 2007 Mintz, Bills, Snow, Jurafsky. 2009. Distant supervision for relation extraction without labeled data. ACL09

- Combine bootstrapping with supervised learning
  - Instead of 5 seeds,
    - Use a large database to get huge # of seed examples
  - Create lots of features from all these examples
  - Combine in a supervised classifier

### Distant supervision paradigm

- Like supervised classification:
  - Uses a classifier with lots of features
  - Supervised by detailed hand-created knowledge
  - Doesn't require iteratively expanding patterns
- Like unsupervised classification:
  - Uses very large amounts of unlabeled data
  - Not sensitive to genre issues in training corpus

# Distantly supervised learning of relation extraction patterns

- of relation extraction patterns

  1 For each relation

  Bor
- 2 For each tuple in big database
- 3 Find sentences in large corpus with both entities
- 4 Extract frequent features (parse, words, etc)
- Train supervised classifier using thousands of features

Born-In

<Edwin Hubble, Marshfield>

<Albert Einstein, Ulm>

Hubble was born in Marshfield Einstein, born (1879), Ulm

Hubble's birthplace in Marshfield

PER was born in LOC
PER, born (XXXX), LOC

PER's birthplace in LOC

P(born-in |  $f_1, f_2, f_3, ..., f_{70000}$ )

### Unsupervised relation extraction

M. Banko, M. Cararella, S. Soderland, M. Broadhead, and O. Etzioni. 2007. Open information extraction from the web. IJCAI

- Open Information Extraction:
  - extract relations from the web with no training data, no list of relations
- 1. Use parsed data to train a "trustworthy tuple" classifier
- 2. Single-pass extract all relations between NPs, keep if trustworthy
- 3. Assessor ranks relations based on text redundancy

```
(FCI, specializes in, software development)
(Tesla, invented, coil transformer)
```

## **Evaluation of Semi-supervised and Unsupervised Relation Extraction**

- Since it extracts totally new relations from the web
  - There is no gold set of correct instances of relations!
    - Can't compute precision (don't know which ones are correct)
    - Can't compute recall (don't know which ones were missed)
- Instead, we can approximate precision (only)
  - Draw a random sample of relations from output, check precision manually

$$\hat{P} = \frac{\text{\# of correctly extracted relations in the sample}}{\text{Total \# of extracted relations in the sample}}$$

- Can also compute precision at different levels of recall.
  - Precision for top 1000 new relations, top 10,000 new relations, top 100,000
  - In each case taking a random sample of that set
- But no way to evaluate recall

Semi-supervised and unsupervised relation extraction
